

Konstantin Belov

Backend Engineer — Payments & Exchange Infrastructure

Vietnam (UTC+7) · Remote | ow@blanq.tech | Telegram: @ow_blanq | github.com/belofflab | acx.st

SUMMARY

Full-stack engineer who designed, shipped and operates a production crypto exchange **solo** — backend, frontend, payment rails, security and ops. Five years of hands-on development (since 2021), specialized in payment integrations and exchange systems on C#/ASP.NET Core and TypeScript/Next.js. I run an AI-agent development pipeline that lets me ship production-grade integrations in days, not weeks. Looking for backend / integrations roles and B2B contracts in payments, crypto and fintech.

EXPERIENCE

Founder & Engineer — ACX (acx.st), crypto exchange platform 2024 – Present

- Designed and operate a production crypto exchange end-to-end: ASP.NET Core backend, Next.js frontend, live rate engine sourcing prices from major CEX feeds with staleness guards and spread management.
- Integrated instant QR-based bank-payment rails and multi-asset crypto flows (USDT, BTC, ETH, LTC) with automated address validation and checksum verification.
- Built the full compliance and security layer solo: automated KYC/AML flow, cold-storage reserve management, 2FA, and a complete legal/policy framework for a registered entity.
- Run 24/7 operations single-handedly: monitoring and alerting, incident response, customer support automation via Telegram bots.
- Shipped an integrated custodial wallet feature and an admin/back-office panel for order and reserve management.

Independent Developer — merchant payment bots & API automation 2021 – Present

- Built Telegram merchant bots covering the full crypto payment cycle: invoicing → on-chain confirmation tracking → automated payout and reconciliation.
- Delivered API automation for crypto services: exchange-rate aggregation, payment-provider integrations, operational tooling.
- Designed blockchain infrastructure integrations across multiple networks (address generation, transaction monitoring, confirmation handling).

AI-ACCELERATED DELIVERY

- Personal agent pipeline (spec → codegen → tests → deploy) built on LLM APIs; a typical payment-provider integration ships in under 48 hours — documented publicly on GitHub.
- Use AI agents for test generation, code review and documentation — solo output comparable to a small team.

SKILLS

Core: C# / ASP.NET Core · TypeScript · React / Next.js · SQL databases · REST & WebSocket APIs

Domain: payment-rail & CEX API integrations · exchange systems · KYC/AML flows · Telegram Bot API · wallet infrastructure (hot/cold)

Tooling: LLM APIs & agent pipelines (Anthropic / OpenAI) · CI/CD & deployment automation · monitoring & alerting

Languages: English — professional working proficiency · Russian — native
